

Revising the Select Query - 1

Problem Statement

Given a *City* table, whose fields are described as

```
+-----+-----+
| Field   | Type   |
+-----+-----+
| ID      | int(11) |
| Name    | char(35) |
| CountryCode | char(3) |
| District | char(20) |
| Population | int(11) |
+-----+-----+
```

write a query that will fetch all columns for every row in the table where the CountryCode = 'USA' (i.e, we wish to retrieve data for all American cities) and the population exceeds 100,000.
