Revising the Select Query - 2

Problem Statement

Given a *City* table, whose fields are described as

```
+-------------+----------+
| Field       | Type     |
+-------------+----------+
| ID          | int(11)  |
| Name        | char(35) |
| CountryCode | char(3)  |
| District    | char(20) |
| Population  | int(11)  |
+-------------+----------+
```

Write a query that will fetch all the city Names for every row in the table where the CountryCode = 'USA' (i.e, we wish to retreive data for all American cities) and their population exceeds 120000.
