Select All

Problem Statement

Given a *City* table, whose fields are described as

```
+-------------+----------+
| Field       | Type     |
+-------------+----------+
| ID          | int(11)  |
| Name        | char(35) |
| CountryCode | char(3)  |
| District    | char(20) |
| Population  | int(11)  |
+-------------+----------+
```

write a query that will fetch all columns for every row in the table.
